Amendments to the Specification:

Please replace the Abstract with the following:

ABSTRACT

The present invention is directed to aneurysm treatment devices which are capable of being delivered to the situs of a vascular aneurysm through a catheter. The treatment devices comprise, in general, a body member formed by at least one support member and an expandable stent having fenestrations and a reactive material selectively applied to the at least one support member to not all of the fenestrations. The body member provide support mechanical support to a weakened or otherwise incompetent blood vessel. The reactive material is capable of restricting or occluding blood flow to the aneurysm, without substantially affecting blood flow through the blood vessel. has a non-reacted state and a reacted state and the reactive material in the reacted state is capable of increasing the resistance to blood flow through said fenestrations.
